Human Computer Interaction is a misnomer.
Rarely do people want to interact with a computer.
They want to interact with people, data, media.
Even gaming isn't about the computer as much as it is about
having fun through a computer.

The Model Human Processor

- Information Input/Output
 - visual, auditory, haptic, movement
- Information stored in memory
 - sensory, short-term, long-term
- Information processed and applied
 - reasoning, problem solving, skill, error
- Emotion influences human capabilities
- Each person is different

The Eye - Physical Reception

- mechanism for receiving light and transforming it into electrical energy
- light reflects from objects
- images are focused upside-down on retina
- retina contains rods for low light vision and cones for color vision
- ganglion cells (brain!) detect pattern and movement

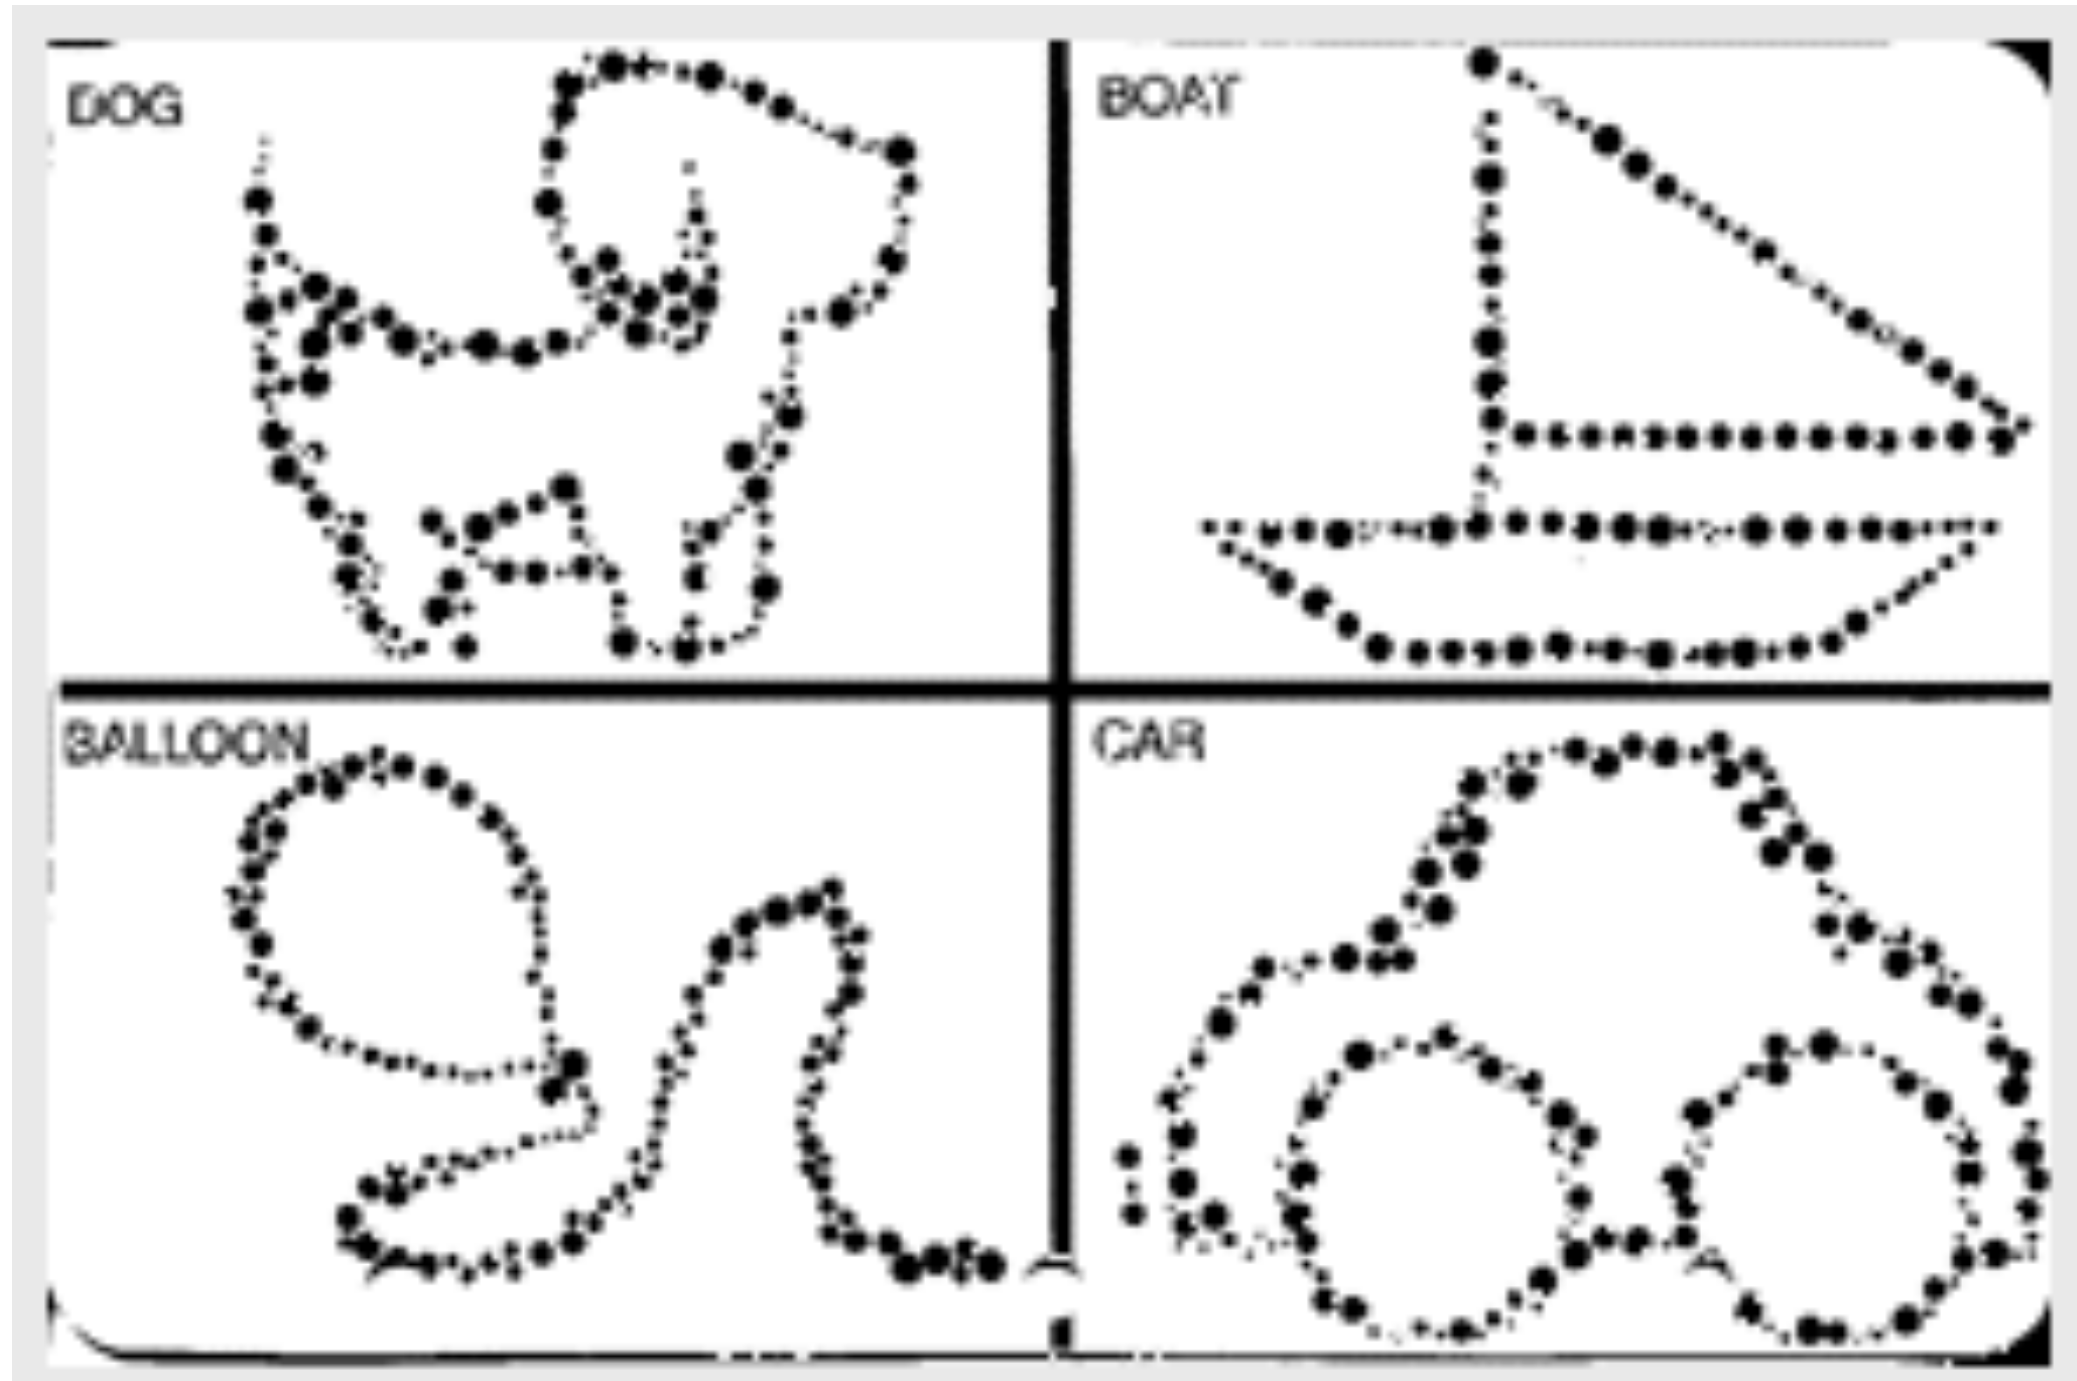

The Eye - Interpreting the signal

- Brightness
 - subjective reaction to levels of light
 - affected by luminance of object
 - measured by just noticeable difference
 - visual acuity increases with luminance as does flicker
- Color
 - made up of hue, intensity, saturation
 - cones sensitive to color wavelengths
 - blue acuity is lowest
 - 8% males and 1% females color blind

DISTRIBUTION OF RETINAL PHOTORECEPTORS

EYE SPECTRAL RESPONSE

rgb

The Eye - Interpreting the signal

- Size and depth
 - visual angle indicates how much of view an object occupies
 - (relates to size and distance from eye)
 - visual acuity is ability to perceive detail (limited)
 - familiar objects perceived as constant size
 - (in spite of changes in visual angle when far away)
- cues like overlapping help perception of size and depth
- thumbnail at arms length is equivalent to 640x480 pixels
 - resolution demo

The Eye - Interpreting the signal

- The visual system compensates for:
 - movement
 - changes in luminance.
- Context is used to resolve ambiguity
- Optical illusions sometimes occur due to over compensation

Your brain heavily compensates for effects of your biology

The Eye - Interpreting the signal

Optical Illusions

The Eye - Interpreting the signal

Optical Illusions

The Eye - Interpreting the signal

Optical Illusions - Chromatic Adaptation

Optical Illusions - Chromatic Adaptation

The background features a dark teal horizontal bar at the top. Below it, the main area is white with three large, overlapping, semi-transparent shapes: a light blue shape at the top right, a light green shape at the bottom left, and a light orange shape at the bottom right. These shapes overlap in the center, creating a white square. The text "Your brain heavily compensates for effects of your biology" is centered horizontally across the middle of the page.

Your brain heavily compensates for effects of your biology

Rubin, N., Nakayama, K. and Shapley, R. (2002), The role of insight in perceptual learning: evidence from illusory contour perception. In: Perceptual Learning, Fahle, M. and Poggio,

- There are similar effects for other input and output
 - Hearing
 - Pitch, Loudness, Timbre
 - Frequency and Processing
 - MP3s
 - Touch
 - Heat, Pain, Pressure
 - Adaptation
 - Movement
 - Reaction Time, Fidelity

Phantom Words

Rubin, N., Nakayama, K. and Shapley, R. (2002), The role of insight in perceptual learning: evidence from illusory contour perception. In: Perceptual Learning, Fahle, M. and Poggio,

“People appear to hear words and phrases that reflect what is on their minds – rather as in a Rorschach test, though it’s my impression that the present effect is stronger. I can bet who is likely to be on a diet, as they report words like ‘I’m hungry’, ‘diet coke’ or ‘feel fat’. And students who are stressed tend to report words that are related to stress – if I play these sounds close to exam time, some students may well hear phrases like ‘I’m tired’, ‘no brain’, or ‘no time’. Interestingly, female students often report the word ‘love’, while male students are more likely to report sexually explicit words and phrases.”

Memory

- Three types of memory which build on each other
 - Sensory Memory
 - Short-Term or Working Memory
 - Long-Term Memory

Sensory Memory

- Buffers for stimuli received through senses
 - iconic memory: visual stimuli
 - echoic memory: aural stimuli
 - haptic memory: tactile stimuli
- Examples
 - non cognitive recall
- Continuously overwritten

Sensory Memory

Aoccdrnig to rscheearch at Cmabrigde uinervtisy, it deosn't mtttaer waht oredr the ltteers in a wrod are, the olny iprmoetnt tihng is taht the frist and lsat ltteres are at the rghit pclae. The rset can be a tatol mses and you can sitll raed it wouthit a porbelm. Tihs is bcuseae we do not raed ervey lteter by itslef but the wrod as a wlohe.

Note: The meaning is probably not accurate
