

Turing Machines

Note Title

3/4/2015

A task a FSM cannot do:

determine if a binary string has more 1's than 0's.

Turing Machine means to model anything that can be computed with any computational device.

Can compute anything you can compute with a laptop.

Simplicity of computing device \leftrightarrow Ease of programming.

Finite tape alphabet: Γ set of symbols
must include "blank": $(\#)$

Finite input alphabet: Σ $\Sigma \subseteq \Gamma$ $* \notin \Sigma$.

Input to the TM is $x \in \underbrace{\Sigma^*}_{\text{set of all strings over } \Sigma}$ string of symbols from Σ .

For example, if $\Sigma = \{0, 1\}$

Σ^* is the set of all finite binary strings
 $= \{ \in, 0, 1, 00, 01, 10, 11, 000, 001, \dots \}$

$$\Sigma^* = \Sigma^1 \cup \Sigma^2 \cup \Sigma^3 \cup \dots$$

Memory = 1-dimensional tape.

Infinite in one direction.

discrete cells - can hold a single character from a tape alphabet.

Starting Configuration of the tape:

  infinite sequence of "blank".

TM has a finite set of states: $\{q_0, q_1, \dots, q_k\} = S$.

Current configuration has a

* current state

* location of a pointer called a "head".

$$\delta: S \times T \rightarrow S \times T \times \{L, R\}$$

Each step is dictated by a transition function:

$$\delta(q_3, 1) = (q_4, 0, L/R)$$

Annotations for the transition function:

- current state: q_3 (pointed to by a red arrow)
- tape symbol at head: 1 (pointed to by a blue arrow)
- new state: q_4 (pointed to by a red arrow)
- new symbol written: 0 (pointed to by a blue arrow)
- left or right: L/R (pointed to by a green arrow)
- head moves by 1 position: \hookrightarrow head moves by 1 position (pointed to by a green arrow)

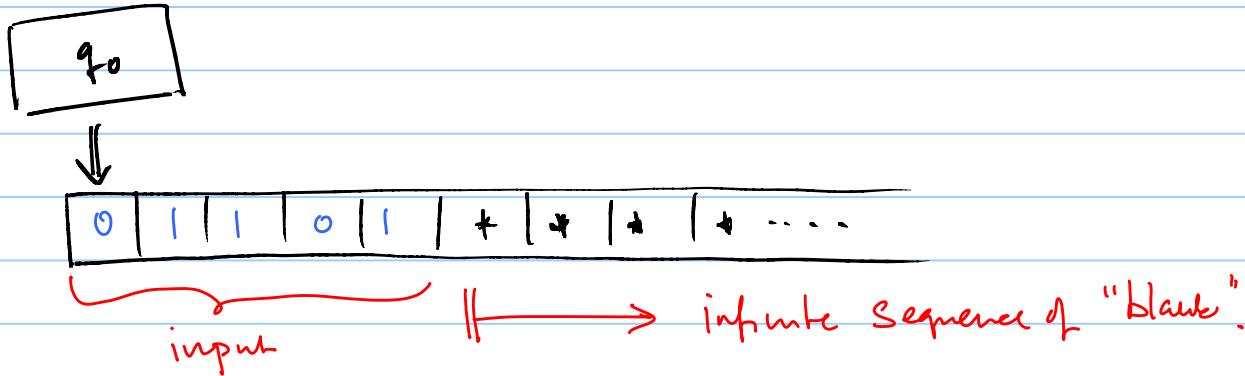

(animation).

Three special States in S :

q_0 : Start State.

q_{acc} : accept State

q_{rej} : reject State.

TM keeps executing steps until it reaches
 q_{acc} or q_{rej}

→ no "next step" from these states.

$$\delta(q_3, 1) = (q_4, 0, \text{L/R})$$

Annotations for the transition function:

- q_3 : current state
- 1: tape symbol at head
- q_4 : new state
- 0: new symbol written
- L/R: head moves left or right by 1 position

$$\underline{\delta}: S - \{q_{\text{acc}}, q_{\text{rej}}\} \times \Gamma \rightarrow S \times \Gamma \times \{L, R\}$$

If final state is q_{acc} : accept input string
If final state is $q_{ rej}$: reject output string.

TM could "recognize" if there are more 1's than 0's in an input string by accepting strings that do have more 1's than 0's and rejecting ones that don't.

Decision vs. Search Problems

Decision problems: output Yes / No

$$\text{Is } 5 \times 3 = 16 ?$$

Is there a path from a to b in G ?

Search / Computation

Compute 5×3

Find a path from a to b in G .

Input must be a string

↪ just need to have a fixed input format.

$$\text{Example 1: } \Sigma = \{a, b\}.$$

$$\Gamma = \{a, b, *\}$$

Accept $x \in \Sigma^*$ iff x has at least two b's.

$$S = \{q_0, \underline{q_1}, q_{acc}, q_{ rej}\}.$$

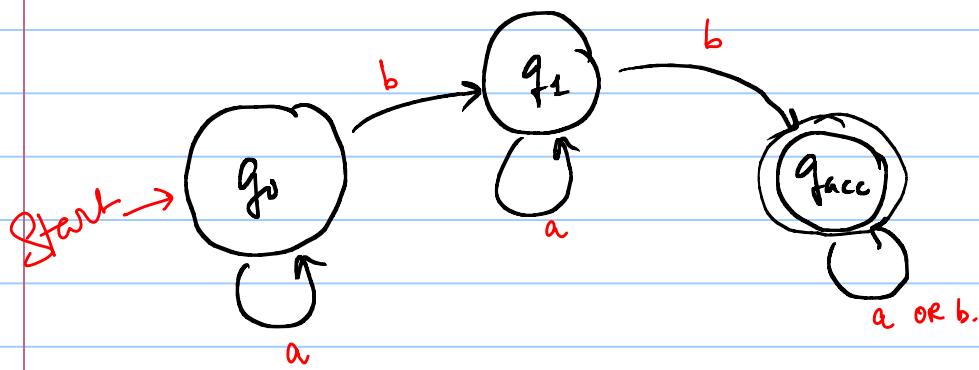

\leftarrow # b's seen so far.

\xrightarrow{L} $a b b a *$

S	\downarrow	\downarrow	\downarrow	\leftarrow	
q_0	a	b	$*$		
q_1	(q_0, a, R)	(q_1, b, R)	$(q_{rej}, *, L)$		

S	\downarrow	\downarrow	\downarrow	\leftarrow	
q_0	(q_0, a, R)	(q_1, b, R)	$(q_{rej}, *, L)$		
q_1	(q_1, a, R)	(q_{acc}, b, R)	$(q_{rej}, *, L)$		

(This task could have been completed by an FSM).

More Complex TM

$$\Sigma = \{a\}$$

$$\Gamma = \{a, x, \# \}$$

Accepts $x \in \Sigma^*$

iff the # characters in x is a power of 2.

if n is a power of 2, can keep dividing n by 2 until you reach 1 with no remainder.

$$8 \xrightarrow{} 4 \xrightarrow{} 2 \xrightarrow{} 1.$$

$$12 \xrightarrow{} 6 \xrightarrow{} 3 \xrightarrow{} x$$

Head shuttles back and forth between the two ends of the string

\downarrow
~~a a a a a a a a *~~ → Change every other 'a' to 'x'
→ Reject if there is an odd
of a's.

→ q_{first} , q_{even} , q_{odd} .
Seen one a
Seen an even # of a's
→ Seen an odd # of a's
(not one).

Design a TM that accepts a binary string if and only if it has the same # of 0's as 1's.

| 0 1 1 0 0 (accept) —
| 0 1 1 0 1 (reject).

Idea: head shuttles back and forth, blanking out 0/1 pairs.

States : q_2 Seen a 0, looking for a 1.
 q_{one} Seen a 1, looking for a 0.

q_{ret} Shuttling back to the beginning.

Characters : Need a X character to blank out 0's + 1's counted.

Moving Right: Start in q_0 (haven't seen anything yet).

See a 0 : replace w/ X, Go to q_2 .

See a 1 : replace w/ X, go to q_{one} .

q_2 : See a 0 : keep moving right.

See a 1 : replace w/ X → return

q_{one} : See a 1 : keep moving right.

See a 0 : replace w/ X → return.

Moving left in graph : Move left until ... ?

E marks left end of stay.

$\begin{matrix} E & E \\ \downarrow & \downarrow \\ X & O & X & | & * & * \end{matrix}$

$\begin{matrix} \downarrow & f_3 \\ X & O & X & | & * & * \end{matrix}$

$\begin{matrix} \downarrow & f_0 \\ 0 & 1 & 1 & 0 & * & * & * \end{matrix}$

$\begin{matrix} & f_2 \\ \downarrow & \\ E & 1 & 1 & 0 & * \\ \downarrow & \text{final.} \\ E & X & 1 & 0 & * \end{matrix}$

$\begin{matrix} \downarrow & f_0 \\ E & X & 1 & 0 & * \end{matrix}$

$\begin{matrix} \downarrow & f_0 \\ E & X & 1 & 0 & * \end{matrix}$

$\begin{matrix} \downarrow & f_0 \\ E & X & E & 0 & * \end{matrix}$

$\begin{matrix} \downarrow & f_0 \\ E & X & E & X & * \end{matrix}$

$$\Sigma = \{0, 1\}$$

$$\Gamma = \{E, X, *, 0, 1\}.$$

$$S = \{q_0, q_2, q_{one}, q_{ret}, q_{acc}, q_{reg}\}.$$

<u>S</u>	<u>0</u>	<u>1</u>	<u>X</u>	<u>*</u>	<u>E</u>
q_0	(q_2, E, R)	(q_{one}, E, R)	(q_0, X, R)	$(q_{acc}, *, R)$	-
q_2	$(q_2, 0, R)$	(q_{ret}, X, L)	(q_2, X, R)	$(q_{reg}, *, R)$	-
q_{one}	(q_{ret}, X, L)	$(q_{one}, 1, R)$	(q_{one}, X, R)	$(q_{reg}, *, R)$	-
q_{ret}	$(q_{ret}, 0, L)$	$(q_{ret}, 1, L)$	(q_{ret}, X, L)	-	(q_0, E, R)
