Second Midterm

You have 75 minutes (until the end of the class period) to complete this exam. There are 55 points possible, so allow approximately one minute per point and you'll have plenty of time left over.

Please read all the problems carefully. If you have a question on what a problem means or what it calls for, ask us. Unless a problem specifically asks about errors, you should assume that each problem is correct and solvable; ask us if you believe otherwise.

In answering these questions, you may use any Python 3 features we have covered in class, in the text, in the lab assignments, or earlier on the exam, unless a problem says otherwise. Use more advanced features at your own risk; you must use them correctly. If a question asks for a single item (e.g., one word, identifier, or constant), supplying more than one will probably not receive credit.

Remember, stay cool! If you run into trouble on a problem, go on to the next one. Later on, you can go back if you have time. Don't let yourself get stuck on any one problem.

You may not share any information or materials with classmates during the exam and you may not use any electronic devices.

Please write your answers clearly and neatly—we can't give you credit if we can't decipher what you've written.

We'll give partial credit for partially correct answers, so writing something is better than writing nothing. But be sure to answer just what the question asks.

Good luck!

Problem 1 (5 points)

Problem 2 (21 points)

Problem 3 (9 points)

Problem 4 (15 points)

Problem 5 (5 points)

Total (55 points)

Problem 1 (5 points) **Topic: Data Types**

A library represents each book in its collection as follows:

```
from collections import namedtuple
Book = namedtuple('Book', 'callnum author title year pages checkedout')
b1 = Book("x12.5a", "Doyle, Arthur Conan", "A Study in Scarlet", 1887, 325, True)
b1 = Book( x12.3a', Doyle, Arthur Conan', A Study In Scallet, 1887, 323, 1
b2 = Book("y153.w", "Christie, Agatha", "Curtain", 1975, 215, False)
b3 = Book("z13.21", "Christie, Agatha", "The Big Four", 1927, 195, True)
b4 = Book("w22.45a", "Doyle, Arthur Conan", "His Last Bow", 1917, 225, False)
BL = [b1, b2, b3, b4]
```

The field callnum is a string with the book's call number (a unique ID for each book). The author and title are strings; the year of publication and the number of pages are ints; the checkedout field is boolean: True if the book is checked out and False if it's still at the library.

The Orange County Public Library system represents each of its branch libraries as follows:

```
Library = namedtuple('Library', 'name address phone collection')
ElTo = Library("El Toro", "24672 Raymond Way, El Toro, CA 92630", "949-855-8173", [b1, b2, b3])
Brea = Library("Brea", "1 Civic Center Circle, Brea, CA 92821", "714-671-1722",
              [b2, b3, b4])
IrvUP = Library("Irvine University Park", "4152 Sandburg Way, Irvine, CA 92612",
                  "949-786-4001", [b1])
Tust = Library("Tustin", "345 East Main Street, Tustin, CA 92780", "714-544-7725",
                  [b1, b4])
OCPL = [ElTo, Brea, IrvUP, Tust]
```

These	definit	ions wi	ll be use	d thro	oughout this	test.			
For each of these expressions, (i) check the box corresponding to its data type and (ii) if it's a list, give its length; if it's a namedtuple, give the value of its first field; otherwise, give its value.

Problem 2 (21 points) **Topic: Processing lists of namedtuples.**

(Continue using the definitions from Problem 1.)

(a) (4 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

```
def book_from_callnum(booklist: 'list of Book', call_number: str) -> Book:
    """ Return the Book with the specified call number, or None if not found.
    """
    for b in ______: booklist
        if b. ______ = ____: callnum == call_number
        return ______b
    return None

assert book_from_callnum(BL, "z13.21") == b3
assert book from callnum(BL, "xyz123") == None
```

(b) (3 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

(c) (4 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

(d) (4 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

(e) (6 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

Problem 3 (9 points) Topic: String processing

(Continue using the definitions in Problem 1.) The following excerpt from help(str) may be useful for this problem.

```
find(...)
   Return the lowest index in S where substring sub is found
                                             split(...)
                                                  S.split([str]) -> list of strings
   substring sub is found.
                                                  Return a list of the words in S,
   Return -1 on failure.
                                                  using str as the delimiter string.
                                                       If str is not specified or is
join(...)
    S.join(list) -> str
                                                 any whitespace string is a separator
   Return a string which is the
                                                  and empty strings are removed from
    concatenation of the strings in the
                                                  the result.
    list. The separator between elements
    is S.
                                              strip(...)
                                                  S.strip([chars]) -> str
                                                  Return a copy of the string S with
replace(...)
    S.replace(old, new) -> str
                                                  leading and trailing whitespace
   Return a copy of S with all
                                                  removed. If chars is given and not
    occurrences of substring old
                                                  None, remove characters in chars
    replaced by new.
```

The address field of a Library contains the whole mailing address in one string. The code below constructs a namedtuple with a separate field for each component of the address.

```
Address = namedtuple('Address', 'street_addr city state zip')

def string_to_Address(entire_addr: str) -> Address:
    """ Create an Address with the contents of the string
    """
    three_parts = entire_addr.split(",")
    street_addr = three_parts[0].strip()
    city = three_parts[1].strip()
    state_zip = three_parts[2].split()
    state = state_zip[0]
    zip = state_zip[1]
    return Address(street_addr, city, state, zip)

assert string_to_Address("5056 Donald Bren Hall, Irvine, CA 92697") == \
    Address("5056 Donald Bren Hall", "Irvine", "CA", "92697")
assert string_to_Address(" 24672 Raymond Way, El Toro, CA 92630 ") == \
    Address("24672 Raymond Way", "El Toro", "CA", "92630")
```

(a) (2 points) When we call string_to_Address("5056 Donald Bren Hall, Irvine, CA 92697"), what is the value assigned to three parts?

```
A. ["5056", "Donald", "Bren", "Hall", "Irvine", "CA", "92697"]
B. ["5056 Donald Bren Hall, Irvine, CA 92697"]
C. ["5056 Donald Bren Hall", "Irvine", "CA 92697"] #THIS ONE
D. ["5056 Donald Bren Hall", "Irvine", "CA 92697"]
```

- E. ["5056 Donald Bren Hall", "Irvine", "CA", "92697"]
- (b) (2 points) When we call string_to_Address("5056 Donald Bren Hall, Irvine, CA 92697"), what is the value of state zip just before we return?

```
A. "CA 92697"

B. ["CA 92697"]

C. ["5056 Donald Bren Hall", " Irvine", " CA 92697"]

D. ["CA", "92697"]

#THIS ONE

E. [" CA", " 92697"]
```

(c) (2 points) Below is an alternative way to write this function:

```
def string_to_Address2(entire_addr: str) -> Address:
   """ Create an Address with the contents of the string
   """
   comma_pos = entire_addr.find(",")
   street_addr = entire_addr[:comma_pos].strip()
   city_state_zip = entire_addr[comma_pos+1:]
   comma_pos = city_state_zip.find(",")
   city = city_state_zip[:comma_pos].strip()
   state_zip = city_state_zip[comma_pos+1:].split()
   state = state_zip[0]
   zip = state_zip[1]
   return Address(street_addr, city, state, zip)

assert string_to_Address2("5056 Donald Bren Hall, Irvine, CA 92697") == \
    Address("5056 Donald Bren Hall", "Irvine", "CA", "92697")
assert string_to_Address2(" 24672 Raymond Way, El Toro,CA 92630 ") == \
    Address("24672 Raymond Way", "El Toro", "CA", "92630")
```

When we call string_to_Address2("5056 Donald Bren Hall, Irvine, CA 92697"), what is the value of city state zip just before we return?

```
A. ["Irvine", "CA", "92697"]
B. "5056 Donald Bren Hall, Irvine, CA 92697"
C. [" Irvine", " CA 92697"]
D. ", Irvine, CA 92697"
E. " Irvine, CA 92697" #THIS ONE
```

(d) (3 points) Below is a function:

```
def you_tell_me(s: str) -> str:
    """ You provide the docstring.
    """
    L = s.split()
    s = " ".join(L)
    return s
```

Which of the following is the best (most accurate) docstring comment for this function?

- A. Returns the same string it was passed.
- B. Returns the parameter with multiple spaces between words reduced to one space. #THIS
- C. Returns a list of the words in the parameter string.
- D. Separates the parameter string into words and joins it back together again
- E. Removes all spaces and punctuation from the parameter string and returns the result.

Problem 4 (15 points) Topic: Lists of namedtuples containing lists

(Continue using the definitions from Problem 1. As always, for full credit you should use functions previously defined on this exam where appropriate, rather than reinventing the wheel.)

(a) (3 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

```
def Library_percentage_checked_out(Lib: Library) -> float:
    """ Return the percentage (0-100) of this library's books that are currently
        checked out.
    """ #SCORING:percentage_checked_out = 2, collection = I
    return ______(Lib._______) percentage_checked_out collection
assert Library_percentage_checked_out(ElTo) == 2/3*100
assert Library_percentage_checked_out(IrvUP) == 100
```

(b) (6 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

(c) (6 points) Complete the definition of the function below, consistent with its header, docstring comment, and assertions, by filling in each blank with exactly one identifier, operator, or constant.

Problem 5 (5 points) Topic: String formatting

(a) (3 points) Suppose we want to print library information in a table formatted as shown:

```
      Pct. Out
      Name
      Phone
      Address

      66.667%
      El Toro
      949-855-8173
      24672 Raymond Way, El Toro, CA 92630

      33.333%
      Brea
      714-671-1722
      1 Civic Center Circle, Brea, CA 92821

      100.000%
      Irvine University Park
      949-786-4001
      4152 Sandburg Way, Irvine, CA 92612

      50.000%
      Tustin
      714-544-7725
      345 East Main Street, Tustin, CA 92780
```

Given a Library, we can produce a formatted string with the Lib to str function below:

Which of the following could we correctly assign to format_string? Circle *one or more* of A, B, C, D, or E; more than one may be correct.

```
A. "{:7.3f}% {:25s}{:12s} {:1s}" #THIS ONE

B. "{7.3f}% {25s}{12s} {1s}"

C. "{:6.3f}% {:25s}{:12s} {:1s}"

D. "{:0.3f}% {:25s}{:12s} {:1s}"

E. "{1:7.3f}% {2:25s}{3:12s} {4:1s}"
```

(b) (2 points) Which one of the following is the correct output from this print statement:

```
print("Replacement cost is ${:3.2f}; place your order now.".format(23599.95))
```

- A. Replacement cost is \$23,599.95; place your order now.
- B. Replacement cost is \$9.95; place your order now.
- C. Replacement cost is \$.95; place your order now.
- D. Replacement cost is \$23599.95; place your order now. #THIS ONE
- E. Replacement cost is \$235; place your order now.

When you're done, please:

- Gather up all your stuff.
- Take your stuff and your exam down to the front of the room.
- Turn in your exam; show your ID if asked.
- Exit by the doors at the front of the room. Don't go back or disturb students still taking the test.
