Multi Cloud File System Team – 10 Nevedha, Shreyas, Siddharth

Overview

- ☐ Highlights of the File System implemented.
- ☐ System Components
- □ Workflow
- ☐ Network Topology
- ☐ System Architecture
- ☐ Code Repo and Structure
- **□**Demo

Highlights of the File System

- Achieve consistent file storage. [uniform across all the clusters]
- Provide single write access using Distributed Mutex.
- Files stored in HDFS (with replications)
- Study and evaluate file storage across multiple clusters.

System Components

Master:

- Maintains meta data of where files are stored
- Handles clients request to read and write files.
- Puts and gets the files from HDFS (deployed on Slave nodes)
- Broadcasts the changes to all other clusters

Slaves:

- The actual place where data files are stored.
- All the slaves in the cluster form a HDFS storage.
- Fault tolerant and replication

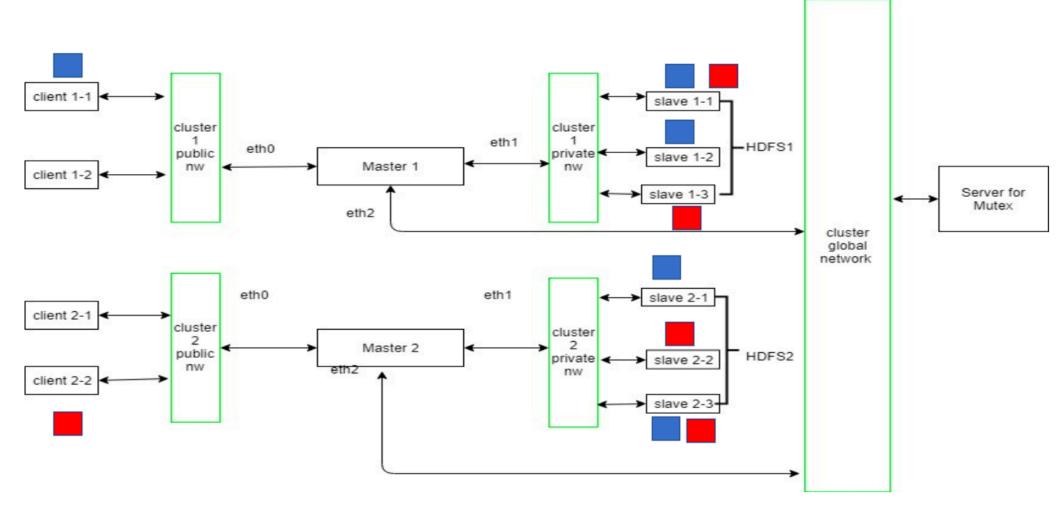

Client:

• Read/Write files

Mutex Server:

- Helps to achieve distributed mutex.
- Maintains a record of which file is being written (holds lock)
- Handles requests from masters to access a file in write mode.
- Fault tolerant (As we have also maintained a backup Mutex Server)

Workflow

Network Topology

Public Networks:

Formed between Clients and Masters

Private Networks:

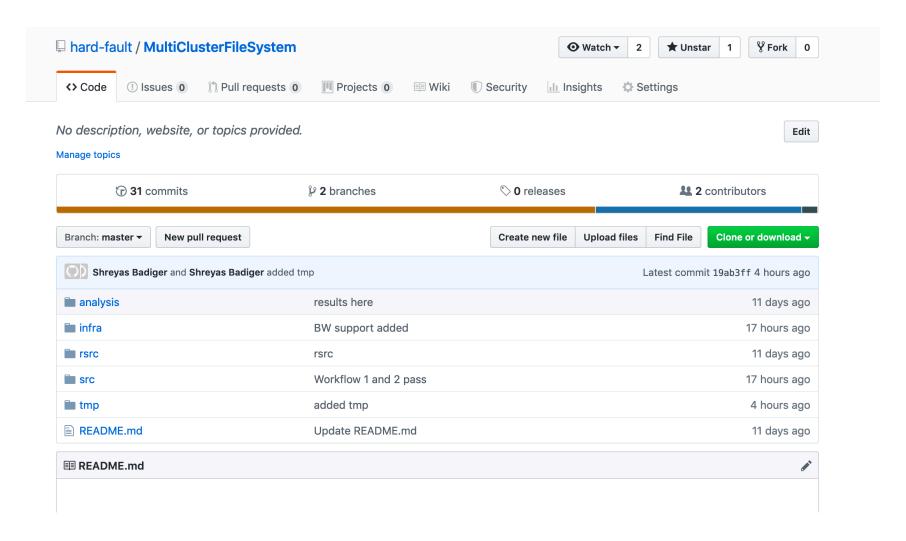

This is where Hadoop File System is deployed Slave nodes aren't visible to outside world

Global Network:

Masters from different clusters communicate over this network Also to achieve distributed Mutex.

MultiClusterFileSystem/
    README.md
                             (Client and Master scripts for fileSystem)
     src
         client
         master
        mutex server
     simulation
                             (Docker containers for simulation and testing)
       config
                             (Descriptive model for container deployment, json file)
       └─ config.json
       - docker
                             (Docker file to build custom docker images)
        └── DockerFile
       setup
         — setup.py
                             (Container deployment script)
        — workflows.py
                             (Testing scripts)
        output
        └── ip.json
                             (Created upon deployment, IPs of containers used by client-servers)
```

Demo

- ✓ Code walk through
- ✓ Deploy Containers
- ✓ Explain workflows
- ✓ Run workflows
- ✓ Tear down the setup. (Easy to reproduce ⁽²⁾)
