

Social Networks

Some content from Ding-Zhu Du,
Lada Adamic, and Eytan Adar

Thesis

- There is much to learn from the interaction between **computer science** and **social science**, to study **social networks** from the lens of computer science.

What is a Network?

A network consists of two or more nodes that are linked in pairs.

Social Network

- Nodes are people (called “actors” or “vertices”)
- Links (called “ties” or “edges”) are relationships

Example 1: Friendship Network

- Nodes: all persons in some community
- A link exists between two persons if they are friends.

Property of Friendship

- **Six Degrees of Separation**

Milgram (1967)

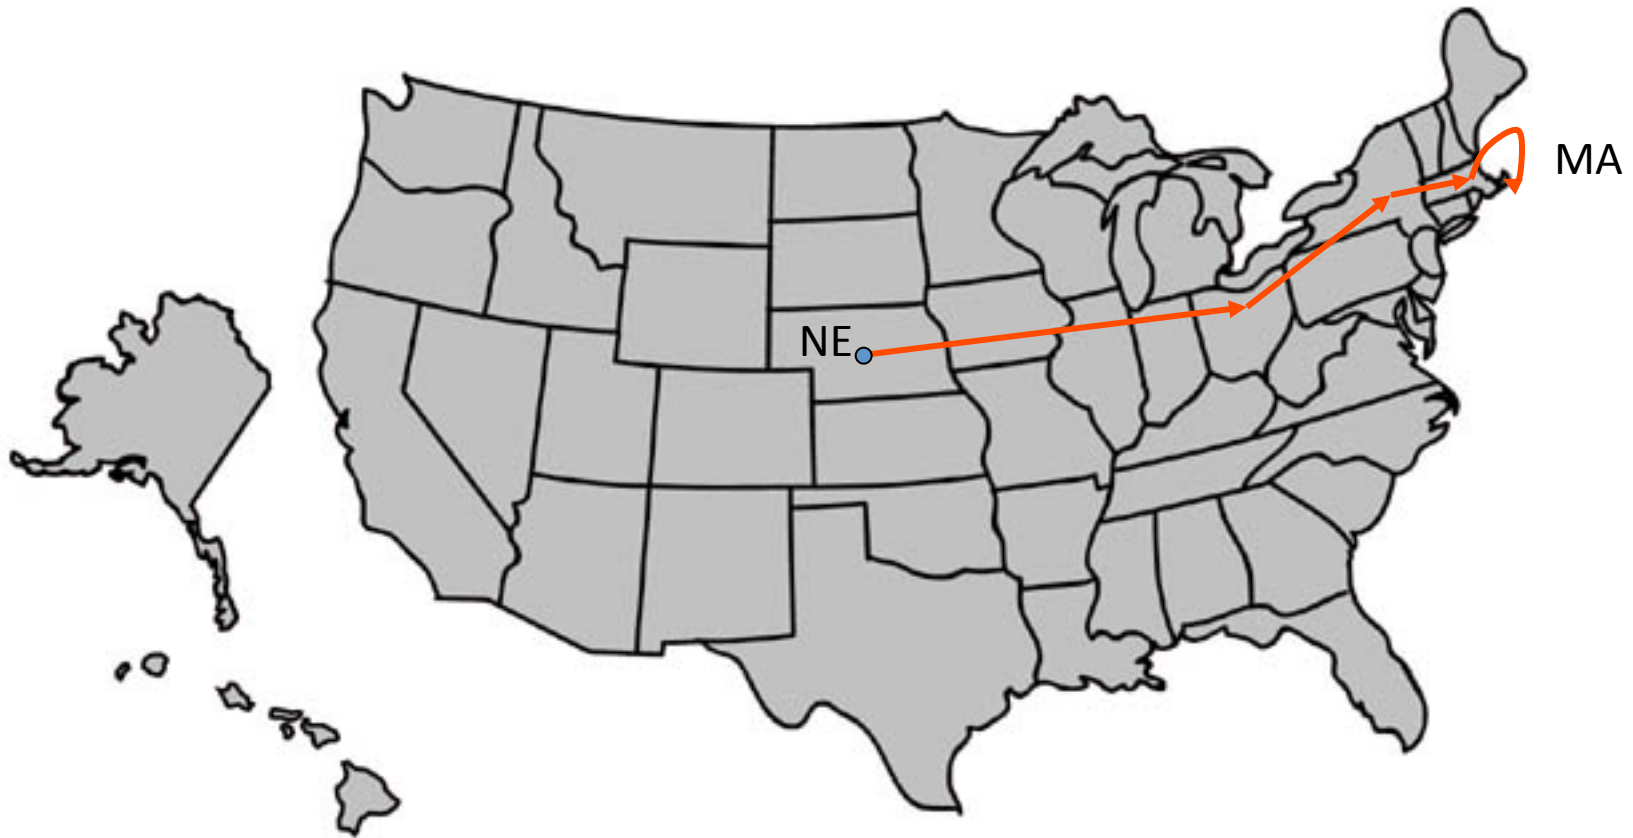

The experiment:

- Random people from Nebraska were to send a letter (via intermediaries) to a stock broker in Boston.
- Could only send to someone with whom they know.

Stanley Milgram (1933-1984)

Small world experiment

Milgram's experiment (1960's):

- Given a target individual and a particular property, pass the message to a person you correspond with who is “closest” to the target.
- “Six degrees of separation”

Small World Network

- “A **small world network** is a type of mathematical graph in which most nodes are not neighbors of one another, but most nodes can be reached from every other by a **small** number of hops or steps.” - Wikipedia

Example 2: Coauthorship Network

- Nodes: all publication authors
- A link exists between two authors if they are coauthors in a publication.

Coauthorship Network is a Small World Network

- **Erdős number:** is the collaboration distance with mathematician **Paul Erdős**.

***What is your
Erdős number?***

Distribution in Dec.2010

Erdős number 0	---	1 person
Erdős number 1	---	504 people
Erdős number 2	---	6593 people
Erdős number 3	---	33605 people
Erdős number 4	---	83642 people
Erdős number 5	---	87760 people
Erdős number 6	---	40014 people
Erdős number 7	---	11591 people
Erdős number 8	---	3146 people
Erdős number 9	---	819 people
Erdős number 10	---	244 people
Erdős number 11	---	68 people
Erdős number 12	---	23 people
Erdős number 13	---	5 people

* Two persons are linked if they are coauthors of an article.

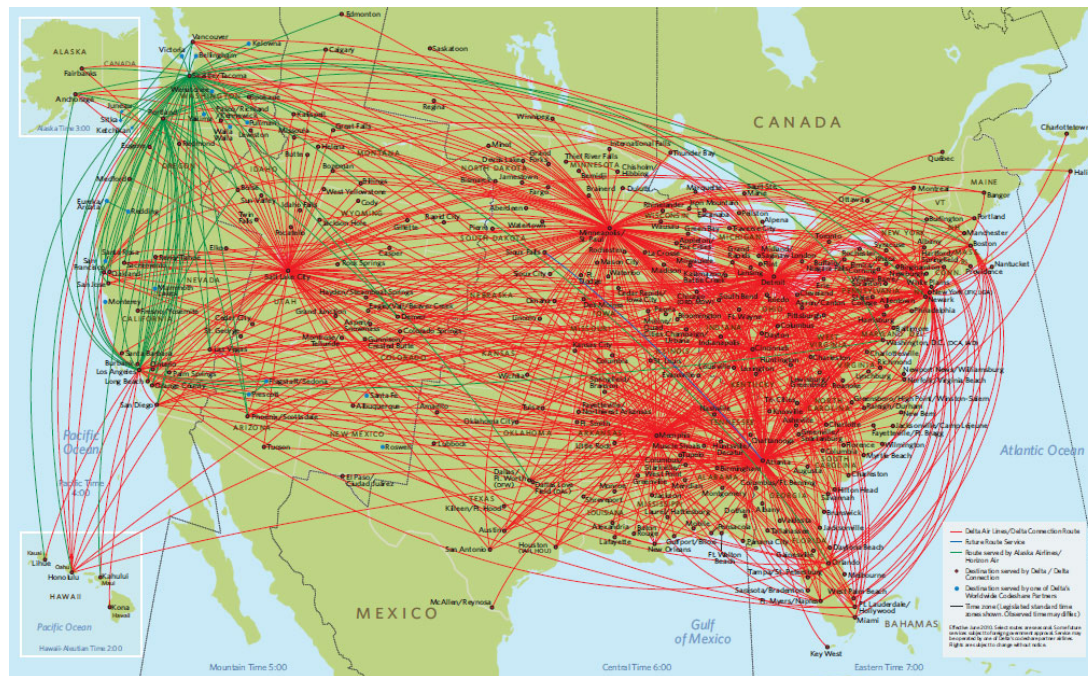

Bacon Numbers

Example 3:

Flight Map Is a Small World Network

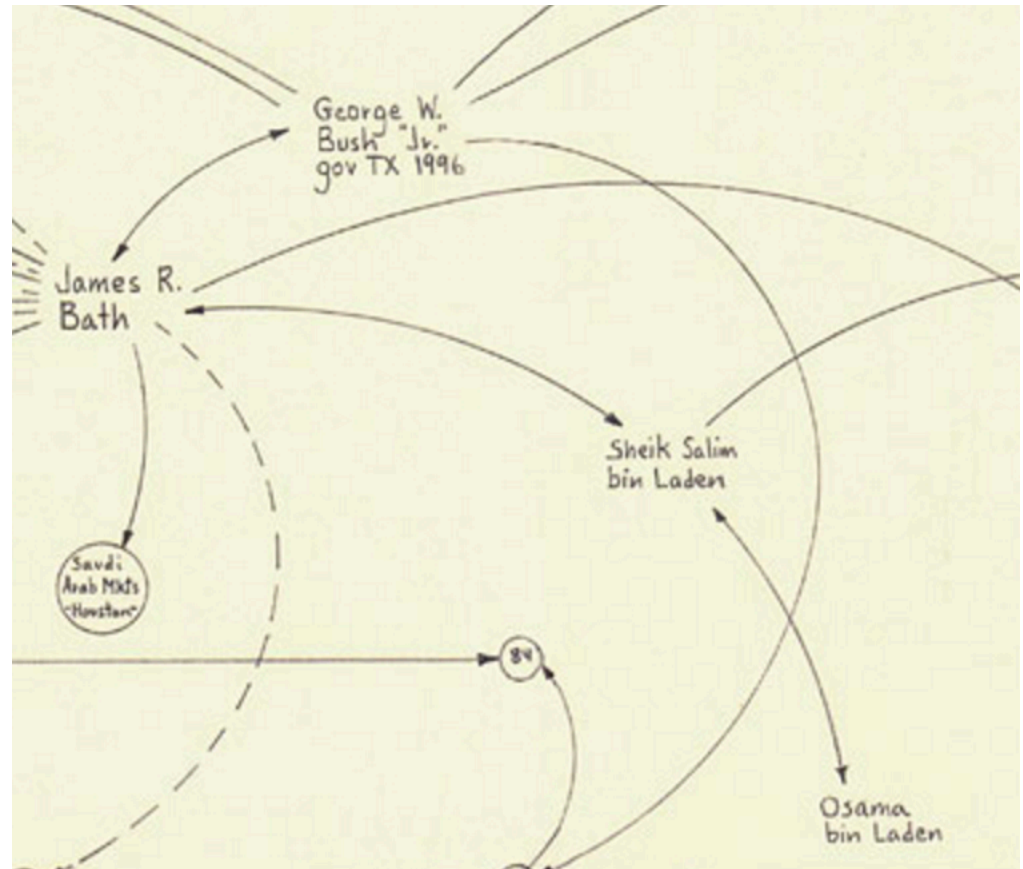

- Nodes: all cities with an airport.
- A link exists between two cities if there exists a direct flight between them.

Social Influence

- Social influence occurs when one's emotions, opinions, or behaviors are **affected by others**.
- Although social influence is possible in the workplace, universities, communities, it is most popular **online**.

The Internet provides a platform to create and study social networks

What Are Online Social Networks Used For?

Content posted on social network

"What do you do with your social networking profile?" Active Internet Universe

Question 1?

Does **Six Degrees of Separation**
imply **six degrees of influence**?

Three Degrees of Influence

- The influence of actions ripples through networks 3 hops (to and from your friends' friends' friends).

I am happy!

Question 2?

How to explain **Six Degrees of Separation** and **Three Degrees of Influence**?

Community

- People in a same community share common interests in - clothes, music, beliefs, movies, food, etc.
- Influence each other strongly.

Power Laws

- Less nodes with higher degree and more nodes with lower degree.
- All peoples are surround leaders.

Examples of Power Laws

Power Laws (Scale-Free Networks)

- Power-law
 - A scale-free network is a network whose degree distribution follows a power law, at least asymptotically.
 - That is, the fraction $P(k)$ of nodes in the network having k connections to other nodes goes for large values of k as
$$P(k) \sim k^{-\gamma}$$
 - Typically γ is in the range from 2 to 3.
 - Many networks have been reported to be scale-free.

Barabási & Albert (BA) Random Graph Model

- Very simple algorithm to implement
 - start with an initial set of m_0 fully connected nodes
 - e.g. $m_0 = 3$

- now add new vertices one by one, each one with exactly m edges
- each new edge connects to an existing vertex in proportion to the number of edges that vertex already has
→ ***preferential attachment***

Common Tasks

- Measuring “importance”
- Diffusion modeling
- Clustering
- Structure analysis
- Privacy

Centrality Measures

- Degree centrality
 - Edges per node (the more, the more important the node)
- Closeness centrality
 - How close the node is to every other node
- Betweenness centrality
 - How many shortest paths go through the edge node (communication metaphor)

Virus/Disease Spread

- Diffusion through networks:
 - Biological viruses in friendship networks
 - STDs in sexual networks
 - Needle sharing in drug user networks
 - Computer viruses in computer networks

Clustering

Looking for Connection Patterns

Looking for Connection Patterns

(Lack of) Privacy

- Privacy in social networks is hard.
- You can be identified by your friends.
- Your data is being collected and stored everywhere you go.
