

PERCEIVING OBJECTS

Visual Perception

Different Approaches

Physiological Approach

Psychophysical Approach

Gestalt Approach

- Gestalt psychology
 - Structuralism : Perception is created by combining elements called *sensation*
- But this cannot explain
 - Apparent Movement
 - Illusory Contours

Apparent Movement

Illusory Contours

Whole is different from the sum of its parts

Basic Philosophy

- The whole is different than the sum of its parts
- Six principles defining perceptual organization
 - How do we combine components to perceive the whole?
 - Is there any basic rules that we use?

Gestalt Principles of Perceptual Organization

- Law of Simplicity
- Law of Similarity
- Law of Good Continuation
- Law of Proximity
- Law of Common Fate
- Law of Familiarity

Law of Simplicity

- Every stimulus pattern is seen in a way that is as simple as possible.

Law of Similarity

- Similar things appear to be grouped together

Lightness

Shape

Orientation

Law of Good Continuation

- Points that when connected are seen as straight or smoothly curving lines tend to be seen as belonging together, and the lines tend to be seen in such a way that they follow the smoothest path.

Law of Good Continuation

- Points that when connected are seen as straight or smoothly curving lines tend to be seen as belonging together, and the lines tend to be seen in such a way that they follow the smoothest path.

Law of Proximity or Nearness

- Things close together appear to be grouped together
- Overcomes law of similarity in this example

Law of Common Fate

- Objects moving in the same direction appear to be grouped together

Law of Familiarity

- Objects appear to be grouped if the groups appear to be familiar or meaningful.

Heuristic and not Algorithm

Where does the heuristics come from?

Palmer-Irvine Principles of Perceptual Organization

- Common Region
- Element Connectivity
- Synchrony

Quantitative Measure of Grouping Effects

■ Repetition Discrimination Task

Perceptual Segregation

- Gestalt Theory
- Reversible figure ground
 - ❑ Figure more object like
 - ❑ Figure seen as being in front of ground
 - ❑ Ground is uniform region behind figure
 - ❑ Separating contours appear to belong to figure

Factors Determining Figure and Ground

■ Figure

- Symmetry
- Smaller Areas
- Horizontal or Vertical

Factors Determining Figure and Ground

- Figure
 - Familiarity

Modern Research

- Role of Contours
 - Likelihood of Occurance
- When does segregation occur?
 - Popular belief
 - First segregation, then recognition
 - Later proved
 - Recognition and segregation may happen in parallel

Perceiving Objects

Physiological Approach

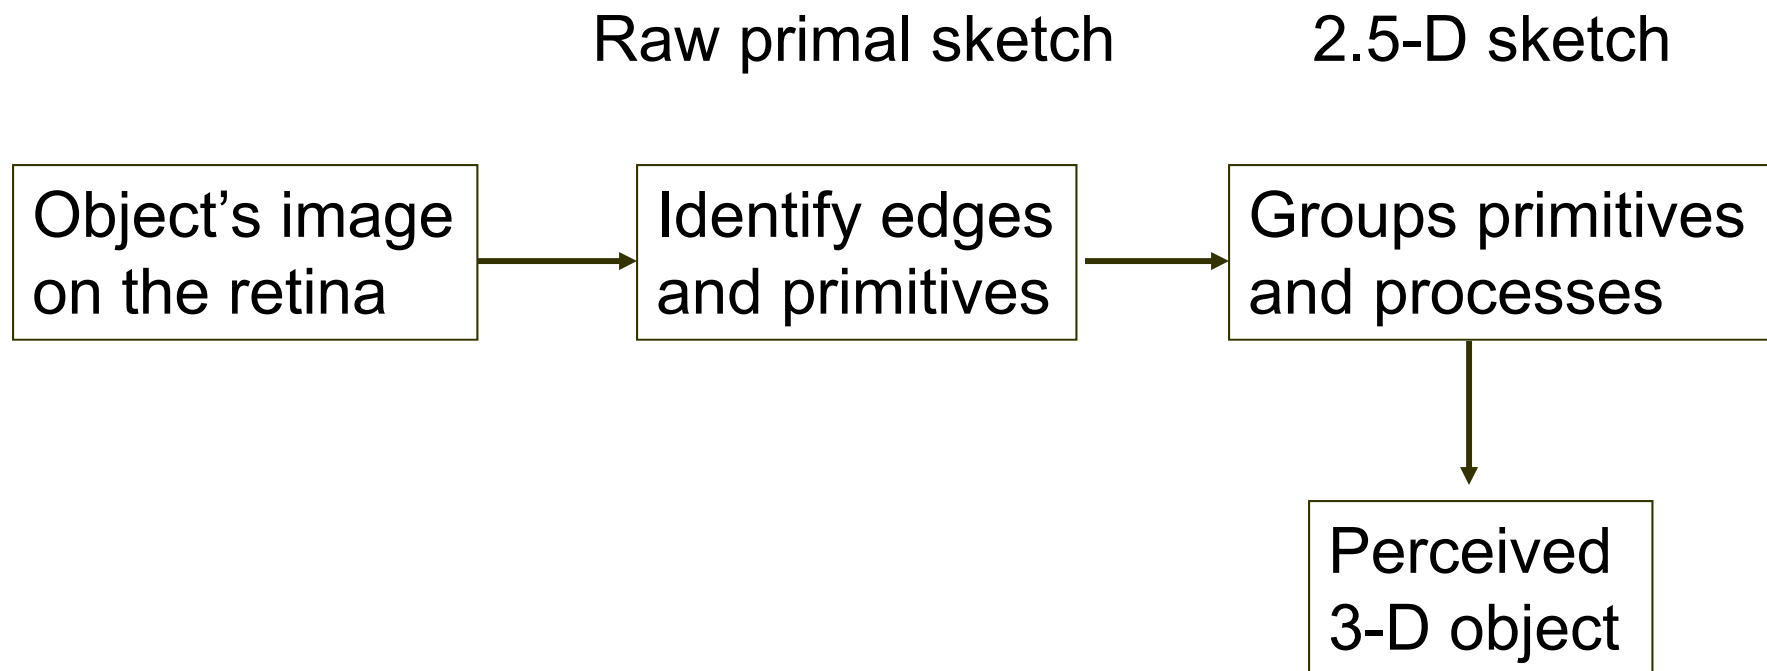

Psychophysical Approach

How Objects are Constructed?

- Marr's computational Model
- Feature Integration Theory (FIT)
- Recognition-by-Components Theory (RBC)

Marr's Theory of Object Construction

■ Computational Approach

Marr's Theory

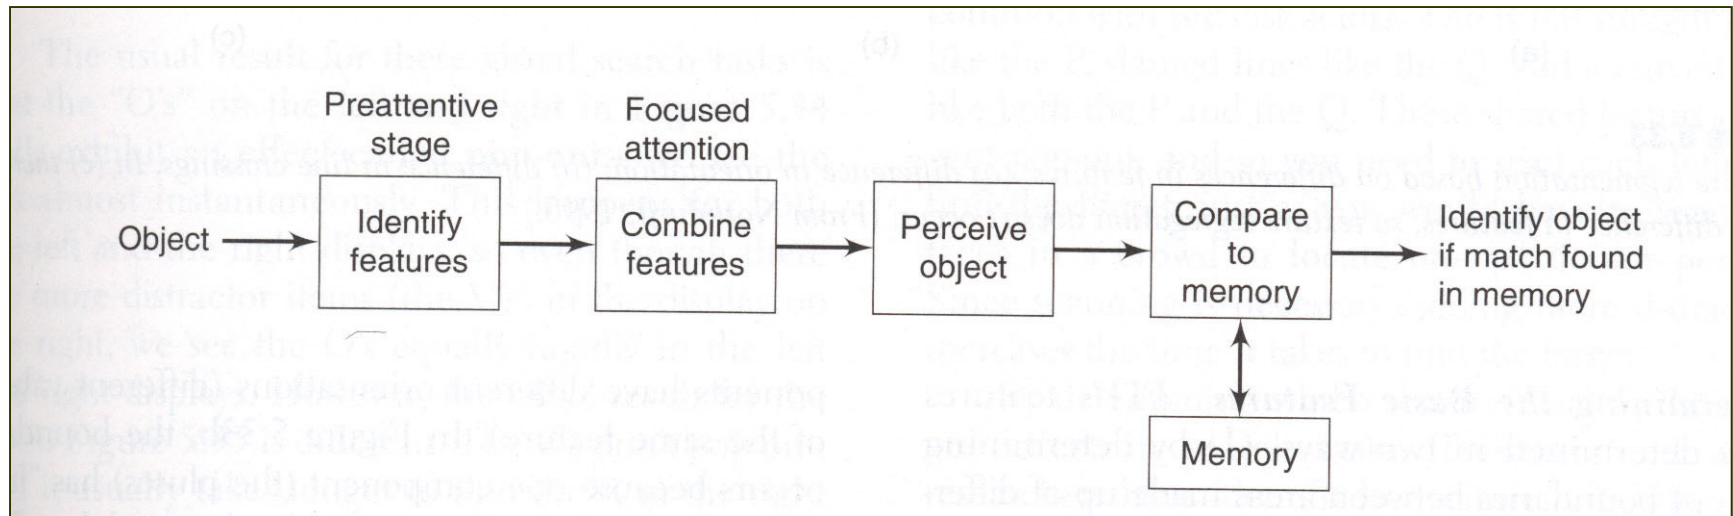

- Computational Approach

- Creation of *raw primal sketch*

- Analysis of light and dark region of retinal image
 - Using natural constraints
 - E.g. Illumination edge vs. geometric edge
 - Do not see this

- Processed to develop a 2.5D sketch

Feature Integration Theory (FIT)

- Preattentive Stage
 - Detects features
- Focused Attention Stage
 - Features are combined to perceive the object

FIT : Preattentive Stage

- Pop-out boundary for detecting features
 - Different Orientation
 - Different Value

FIT : Preattentive Stage

- Visual Search Detection Time
 - Constant with increase in number of distractors if target has pop-out features
 - Increases with increase in number of distractors if target has no pop-out features
 - Have to scan each distractor and eliminate

Similar to Salience

FIT: What makes things pop out?

- Curvature
- Tilt
- Line ends
- Movements
- Color
- Brightness
- Direction of Illumination

FIT : Preattentive Stage

- Independent features
- No association with objects
- Same observation from physiology

FIT : Focused Attention Stage

- Attention is essential for combining features
- Same result from physiology

Recognition-by-Components (RBC)

- Volumetric Primitives
 - Geons
- Principle of componential recovery

Properties of Geons

- View invariance
- Discriminability
- Resistance to visual noise

Cannot be mathematically enforced. Not very formal. Limitation of many psychophysical model. No hard quantification.

RBC theory

- + Can identify objects based on a few basic shapes
- - Cannot help us detect the finer details which causes difference

Comprehensive Model

- Image Based Stage
- Surface Based Stage
- Object Based Stage
- Category Based Stage

Image Based Stage

- Retinal Image
- Local feature detection

Image Based Stage

- Retinal Image
- Local feature detection
 - Edges, Corners, blobs
 - Raw primal sketch
- Global relationship between them
 - Full primal sketch
 - Difficult

*Similarity with Marr's
Primal Sketch*

Image Based Stage

- *Primitives*

- 2D structure of image intensities
 - Features like edges, blobs, corners etc

- *Geometry*

- Two dimensional

- *Reference Frame*

- Retinal

Surface Based Stage

- Find intrinsic property of surfaces in the real world
- Surfaces in 3D world as opposed to 2D primitives
- Visible surfaces from which light reflect to our eye
- *Intrinsic Images*

Surface Based Stage

- Represented by 2D planar elements in 3D
 - 3D surface can be represented by infinite 2D planar elements
 - Properties
 - Distance from viewer
 - Slant
 - Shading (as color or texture)
 - Like a 2D rubber sheet wrapped on the face of the visible surfaces.

*Similarity with Marr's
2.5D representation*

Surface Based Stage

- *Primitives*
 - 2D planes embedded in 3D
- *Geometry*
 - Three dimensional
- *Reference Frame*
 - Viewer dependent

Object Based Stage

- We have some 3D definition
 - Otherwise, surprised when hidden surfaces got exposed
- Two types of representation
 - 2D patched in 3D
 - 3D volume elements
 - Hierarchical

*Similarity with
Recognition by
Components*

Object Based Stage

- *Primitives*
 - 2D planes embedded in 3D
 - Volumes
- *Geometry*
 - Three dimensional
- *Reference Frame*
 - Object dependent

Category Based Stage

- Categorization
- Identification
- Cognitive Science
- Deals with knowledge in perception
- How it helps us survive
- What about more frames? The temporal domain is not explored that much

Relationship to Graphics

- OpenGL triangular rendering
 - 2D triangle mesh embedded in 3D
 - Triangle is smallest planar 2D elements
- Volume Rendering
 - Uses volumes as primitives
- Image based Rendering
 - Depth Images analogous to surface based representation
 - That is why a view dependent rendering scheme is adopted
 - Since no object based information, difficulty in handling occlusion

Role of Intelligence in Object Perception

- Ambiguous Stimulus
 - Inverse Projection Problem

Role of Intelligence in Object Perception

- Ambiguous Stimulus
 - Inverse Projection Problem
- Objects not separated
- Occlusion
- Ambiguity in lightness

Intelligence Heuristics

- Occlusion
- Light from above
