Prologue: I take academic integrity very seriously: it is a core value for a teacher and researcher (and should be for a student too). Therefore, I want to state unequivocally what behavior I expect from everyone in this course. Although I do not want to brow-beat you on this topic, I have learned that it is best to deal with this issue early and clearly, before any questionable incidents occur. So, as a preventative measure, I am asking everyone to read, sign/date, and return this document. A blank copy is available on the Handouts link on the course web page for your future reference. I will not record your grades until you sign, date, and return this document to me. We will discuss it in class beforehand.

Summary: Do your own work, not sharing materials (unless explicitly instructed) nor using materials unavailable to all your classmates, especially those affording you an unfair advantage in earning a grade (e.g., materials collected from previous quarters, other students, or online). I expect students who are (re)taking ICS-33 to (re)do all work on their assignments this quarter, without examining/referencing materials collected if they took this course previously; discard all materials that you have collected, NOW. Finally, no one should examine/download/use any parts of solutions to the same/similar problems posted on web repositories, even if it is just to help them to conceptualize/write/debug their own code (nor should they post their own solutions). In fact, you should not search for (or post materials) on CourseHero, Chegg, GitHub, StackOverflow, or any other sites like these. For questions, search my notes; use Piazza, talk to Staff. If your google queries include “ICS-33” or parts of questions, or the names of programs/functions that you are writing, you are committing Academic Misconduct.

Bottom line: Better to get a lower grade on an assignment than cheat, get a 0, and have your case sent to the Academic Integrity and Student Conduct Office. No one is entitled to any grade; you must earn every one. Start assignments early. If you use any information from the web, cite its url in the work you submit, as you would in a paper.

Homework Problems from Lectures: These are not graded, so you may collaborate with anyone and do not need to acknowledge collaboration on your work. In fact, I encourage collaboration on these problems and posting solutions.

Take Home Quizzes: You can spend as much time as you want, but you are expected to do all your own work. All course materials are acceptable resources for solving these problems (the needed information appears in the notes) as well as the Python Webpages linked to the ICS-33 fact sheet. But students may not use the internet to search homework solving/archiving websites like CourseHero, Chegg, GitHub, StackOverflow, etc. to find answers/exact solutions posted for the problems (or similar problems) asked. Students should not post on such websites nor distribute any problems or their solutions to other students or on the web. Students may not discuss nor exchange the material on these quizzes: they may not collaborate with each other, nor receive written or oral help from anyone (except the instructor), whether it be in person, by phone, e-mail, texting, etc. For clarifying what a problem means: post on Piazza, so everyone can see the answer; ask staff.

Programming Assignments: Some programming assignments allow (others disallow) students to work in pairs, submitting one copy of their joint work. When working in pairs, designing, synthesizing, documenting, analyzing, and debugging code while discussing it with your partner is an integral part of the assignment; all are important skills that we expect you to acquire. You are also welcome to discuss high-level ideas about a programming assignment with anyone else. It is fine to discuss its specification and approaches to designing/solving the problem, to draw pictures or object diagrams, etc. In fact, you are even welcome to discuss with other students, at a high level, how to debug your code.

But, the student/pair seeking help may not examine code written by any other students/pairs, and may not show their code to other students/pairs who are helping them debug it. I don’t want to limit high-level discussions about the assignment, but you absolutely cross a real boundary when you examine another student’s/pair’s code or show your code to other students/pairs for help when debugging: I expect you to wrestle with some problems on your own (or jointly, with your partner). Think of a history paper: you can discuss the material in class and with other students, but you must write your own outline, using all your own words when you write the paper, and proofread it yourself. Looking at someone else’s paper or showing someone else your paper invites plagiarism; it is the same with code.

If a “friend” asks you to show him/her your code, you are opening the door wide for a possible charge of academic misconduct, for both of you. Never email a copy of your code or provide a printed version. I have seen friendships crumble when student A innocently supplies a copy of his/her code to student B, who then plagiarizes it, getting both in trouble. Do not be an accessory to misconduct; truly help a friend by saying “no” to such a request. The best source for help on programming assignments is the instructor or staff (TAs, Readers, or Lab Tutors) in person (office and lab hours) or by e-mail. We are experienced at providing the right level and kind of information
and help, designed not only to solve your immediate problem, but other similar ones that may arise later in the quarter. Better yet, think carefully and post a good question on Piazza, where all students benefit from the answer.

*We use the program Moss (Measure of software similarity) to analyze all submitted programs.* Moss does a thorough job of comparing code (in ways designed to detect cheating: so operations like changing names, moving code around, etc. don’t fool it). This information is automatically indexed on a webpage that makes it very efficient for me to examine the similarities that it detects (adding in my over 40 years of experience with this issue). The programs that we choose to examine closely have similarity metrics a few standard deviations above the mean (they are very very similar). When I use assignments from previous quarters, I run moss with solutions from those quarters as well. I will try to demonstrate Moss during one of the lectures, so you can see it in action.

**In-Class (written/programming exams):** Students are expected to do all their own work, quietly in the classroom (no shouting with joy when they debug a function/method), and do it during the allotted time (stopping when directed), with the benefit of only the materials explicitly allowed during the exam. Students may not bring in any other materials, nor access such materials nor communicate with each other directly or via any technology: cell-phones, PDAs, calculators, pagers, IM, e-mail, miniature cameras, etc.). Students should not discuss information about an exam with other students, until **the end of the day: after all students have taken the exam.**

Students have been caught bringing unauthorized notes into exams, copying from a neighboring student, and using a smart-device to access the web during an exam. Please put all your materials (including electronics) underneath your desk before you start any written exam or in-lab programming exam. No headphones allowed.

**Tutors:** LARC tutors are trained to know how to help students learn the material without doing their homework for them. If a student hires a private tutor, the tutor may not do the student’s homework nor even help the student with his/her homework (e.g., quizzes and programming assignments). Hiring a tutor who does your work, or helps with your work, violates this Academic Integrity Contract. Tutors can only help you learn the material, not do your work.

**Penalties:** The penalty for violating this contract is a 0 on the entire assignment (even if cheating occurred on only part: it is much better to leave some part blank and lose only a few points). In addition, I also send a letter to the UCI Office of Academic Integrity and Student Conduct (OAISC), who will contact the student and then pass this information along to the Associate Dean of Student Affairs in the student’s School (ICS). A first offense is typically treated as an educational experience, but a second offense typically results in suspension from UCI for 1-2 quarters. Avoid any/all offenses.

**A Safety Clause for Collaboration:** If you collaborate with anyone, or get information from the web, document it (cite the source, as you would on research papers that you write) on the work you submit, by including the name of that person and the nature of the collaboration, or the URL. Doing so helps insulate you from any Academic Misconduct charge: I cannot charge plagiarism when a citation properly appears clearly on the work. But, if I believe you received unauthorized help or used unauthorized materials, I can lower your grade.

**General Advice:** If you are unable to perform well on an assignment, contact me immediately to discuss the problem (you will be at a disadvantage if you wait until the last minute to start your assignments: the biggest reason students commit academic misconduct is poor time-management skills); such problems can be resolved in many ways. I should be your first contact point in stressful situations. Of course, you can also seek appropriate help from your TA, Reader, and/or Lab Tutor. Remember, if a friend comes and asks to see homework prohibited by this agreement, don’t show it to him/her. I understand the peer pressure to “help a friend”, but let me assure you that this is truly not the way to help: you are exposing your friend—and yourself—to a 0 grade, and a possible University-level penalty; a friend wouldn’t ask you to expose yourself in this way. Finally, if a student commits academic misconduct and feels guilty about it, and admits it to me before I contact the student, he/she will receive only a grade of 0 (with no letter and therefore no University-level penalty). This is rare, but happens.

**Bottom Line:** Faculty are here (and assignments are designed) to maximize your learning and ensure that you receive a fair grade. If you cannot trust us to perform this function faithfully, and cooperate with us to do so, you are missing something important in your education at UCI. I want to create a positive environment, where students can truly help each other (knowing which boundaries not to cross when asking for or providing help); but students also know that I will look for cheating and lower grades and report cheating when I find it.

**Signature:** Acknowledge that you have read this document and understand it; see me, or post on a forum, if you need any clarification. You must adhere to the letter and spirit of its content during this course, or receive the stated penalties.
