## Name:

$\qquad$
ID \#: $\qquad$ Seat (Row, \#): $\qquad$

## Problem 1: ( $\mathbf{3 6}$ points; 3 points each)

For each of the following terms on the left, write in the letter corresponding to the best answer or the correct definition on the right. The first one is done for you as an example.

| A | Agent | A | Perceives environment by sensors, acts by actuators |
| :--- | :--- | :--- | :--- |
| H | Percept | B | All states reachable from the initial state by a sequence of actions |
| M | Performance Measure | C | Guaranteed to find a solution if one is accessible |
| I | Rational Agent | D | Set of all leaf nodes available for expansion at any given time |
| B | State Space | E | Maximum number of successors of any node |
| G | Path | F | Guaranteed to find lowest cost among all accessible solutions |
| F | Optimal Search | G | Sequence of states connected by a sequence of actions |
| C | Complete Search | H | Agent's perceptual inputs at any given instant |
| J | Expand a state | I | Agent that acts to maximize its expected performance measure |
| D | Frontier | J | Apply each legal action to a state, generating a new set of states |
| L | Search Strategy | K | Estimates cost of cheapest path from current state to goal state |
| E | Branching Factor | L | How a search algorithm chooses which node to expand next |
| K | Heuristic Function | M | Evaluates any given sequence of environment states for utility |

## Problem 2: ( 16 points; 4 points each)

Mark the following statements as True (T) or False (F).

| T | Breadth-first tree search is complete for the 8-Puzzle problem (as defined in class or textbook) |
| :--- | :--- |
| T | Breadth-first tree search is optimal for the 8-Puzzle problem |
| F | Depth-first tree search is complete for the 8-Puzzle problem |
| F | Depth-first tree search is optimal for the 8-Puzzle problem |

## Problem 2: (48 points; 12 points each)

Execute "Tree Search" through this graph (i.e., do not remember visited nodes). Step costs are given next to each arc. Heuristic values are given in the table (as $h(n)=X$ ). The successors of each node are indicated by the arrows out of that node. Successors are returned in left-to-right (equivalent: alphabetical) order.

For each search strategy below, show the order in which nodes are expanded (i.e., to expand a node means that its children are generated), from start node $S$ and ending with the goal node $(G)$ that is found. Show the path from start to goal, or write "None". Give the cost of the path found. The first is done for you as an example.

$$
\begin{aligned}
& h(S)=12 \\
& h(A)=8 \\
& h(B)=12 \\
& h(C)=3 \\
& h(D)=7 \\
& h(E)=1 \\
& h(G)=0
\end{aligned}
$$

## Depth-first search

Order of node expansion: S A D (G)
Path found: S A D G
Cost of path found: $\mathbf{1 8}$

## Uniform cost search

Order of node expansion: S B A C D E (G)

Path found: S B C E G Cost of path found: $\mathbf{1 4}$

## Greedy (best-first) search

Order of node expansion: $\underline{\text { S A (G) }}$
Path found: S A D G
Cost of path found: $\mathbf{1 8}$

## Iterative deepening search

Order of node expansion: $\underline{\mathbf{S} ; \mathbf{S} \text { A B }}$
Path found: S B G
Cost of path found: $\mathbf{2 2}$

## A* search

Order of node expansion: S A B C E (G)
